

Benjamin Moore®

SPECIFY THE
RIGHT PAINT USING
MPI® STANDARDS

Benjamin Moore & Co. works closely with the Master Painters Institute® (MPI) to ensure our comprehensive and versatile portfolio meets the high standards of the commercial painting industry, with approvals in over 135 categories.

To set architectural coatings standards, MPI performs tests to evaluate paint's performance in areas such as hide, gloss, scrubability, dry time, application, and flexibility. Benjamin Moore's products often meet highest MPI performance standards across categories, making our paint cost-effective and efficient.

For example, Fresh Start® High-Hiding All-Purpose Primer meets MPI standard #6 (primer, exterior wood), #17 (water-based bonding primer), #39 (primer, interior wood), #50 (primer sealer, interior latex), and #137 (primer, stain blocking), allowing painters to use one product to meet a project's multiple needs. Ultra Spec® 500 in an eggshell finish meets MPI standard #52 (good), #145 (better), and #139 (best), offering a high-quality product that painters can trust.

In an era of increasing environmental consideration, all products that meet the MPI X-Green™ (Extreme Green) standard—MPI's most stringent green performance standard—also qualify for LEED® v4.

Through MPI, painters have full transparency into the exceptional performance of Benjamin Moore's products, giving them the confidence to choose the right products for their projects.

MASTER PAINTERS INSTITUTE® – MPI

MPI Background

MPI Background

The Master Painters Institute has been qualifying products for the Approved Products List since 1967. Headquartered in Vancouver, Canada, MPI is an institute dedicated to the establishment of quality standards and quality assurance programs, training, and publications for the architectural paint and coatings sector in the U.S. and Canada. MPI performance-based paint and painting specifications are used by the U.S. military; by the AIA MasterSpec, referenced by approximately half of U.S. architects; by NASA for facilities; by U.S. Veterans Affairs hospitals; by the Canadian government's National Master Specification; and by thousands of other North American designers and facility managers.

Criteria for MPI Approved Listing

These listings meet current MPI standards for approval and listing. Information on MPI "Detailed Performance," "Evaluated Performance," and "Intended Use" product specifications are available from MPI. MPI "Detailed Performance" and MPI "Evaluated Performance" products require the manufacturer's technical certification that the product meets either the required MPI "Detailed Performance" definition or the MPI "Evaluated Performance" definition. Both require verification by MPI lab tests. Continued listing is dependent upon random MPI confirmation testing. MPI "Intended Use" products require the manufacturer's technical certification that the product meets MPI's "Intended Use" definition and requirements. At the time of printing, all listings were certified by the manufacturer to meet MPI performance standards. MPI reserves the right to require periodic testing of products listed under MPI "Detailed Performance" categories to ensure continued compliance, and reserves the right to withdraw approval at any time of noncomplying products. As a condition of listing, manufacturers are obligated to notify MPI of a material change in formulation that may affect product performance.

MASTER PAINTERS INSTITUTE® – MPI

The information in this guide is sourced, with permission, directly from MPI's website.

MPI's Green Performance® Standard

A program investigating Ozone Forming Potential (OFP), initiated by the National Institute of Building Sciences, addressed coating performance relative to environmentally preferable products with the following: "Given that the primary function of paints and coatings is to provide protection for coated surfaces, and thus extend the life of such surfaces, it is imperative for any environmentally preferable product specification to address the equivalence in performance between products being compared. Inadequate consideration of product performance in the past has led to a selection of paints and coatings that have not provided comparable performance, leading to the premature aging of structures on the one hand, or excessive product use to offset performance shortcomings on the other hand."

Also in the draft specification was the requirement that "only products appearing in the current edition of the MPI Approved Products List under the category for the intended application will be considered for certification, and that continued listing in the MPI Approved Products List will be a condition of maintaining the certification." The MPI Green Performance® Standard therefore requires that all products shall meet the performance requirements of the applicable MPI product standard, evidenced by current listing in the MPI Approved Products List.

Essential Elements of MPI's Green Performance Standard

- Performance
- Chemical Component Restrictions
- Maximum Allowable Limits of Volatile Organic Compounds (VOCs)

Chemical Component Restrictions The MPI Green Performance Standard requires that the manufacturer shall demonstrate that the following chemical compounds are not used as ingredients in the manufacture of the product:

Acrolein	Ethylbenzene
Acrylonitrile	Formaldehyde
Antimony	Hexavalent Chromium
Asbestos	Isophorone
Benzene	Lead
Butyl benzyl phthalate	Mercury
Cadmium	Methyl ethyl ketone
Diethyl phthalate	Methyl isobutyl ketone
Dimethyl phthalate	Methylene Chloride
Di-n-butyl phthalate	Naphthalene
Di-n-octyl phthalate	Toluene (Methylbenzene)
1,2 -dichlorobenzene	1,1,1 -trichloroethane
Di (2-ethylhexyl) phthalate	Vinyl Chloride

IARC – Group 1 Carcinogenic to humans [excluding crystalline silica, not in the form of quartz or cristobalite dust].
